

ways to **boost security** when using **RECORD & REVIEW PROCTORING**

Compared to no proctoring at all—there are security advantages to using R&R proctoring. However, because of the limitations of *any type* of proctoring, you'll want to bolster your test security in other ways, too.

Use an R&R proctoring audit service where **trained security professionals** review recorded test sessions and efficiently flag suspicious incidents.

Use **protective exam designs** that make many types of cheating and test theft ineffective (e.g. SmartItem™ or DOMC™). Bonus: These designs make reviewing test sessions more efficient by greatly reducing the number of security threats.

Use other security methods, such as **monitoring the web** for exposed test content and **data forensics analyses** to detect potential security incidents in your test results.

Use **deterrence communications** to convince would-be cheaters they shouldn't even try. For example, you can require examinees to sign an oath not to cheat, provide them with a list of automatic sanctions for cheating, or simply publicize the vast array of security methods you are using.

Be sure to make students aware of (and agree to) the fact that reviews of recorded test sessions may take weeks or months to conclude. Remind them that their **test scores are “provisional”** until the reviews have all been completed.
